HealthTech Products, LLC

October 7, 2007

Our research division, Health and Medical Research, is an independent company that has conducted "third-party" independent clinical trials on Mannatech's glyconutrient supplements over the past 13 years. A list of the members of our scientific advisory board who have often served as co-investigators for these studies is on the reverse side.

I'm often asked for a "bottom line" describing our findings of our 13 years of research. In responding, I have limited my remarks only to the findings that have been published. Our studies suggest that taking these glyconutrient supplements can:

1. **Improve bone strength by increasing bone mineral density**
2. **Aid in the reduction of excess body fat**
3. **Help maintain or increase lean (muscle) mass**
4. **Facilitate or maintain healthy cholesterol and blood lipid levels**
5. **Increase self-reported quality of life**
6. **Improve immune health as measured by C-reactive Protein (CRP) levels.**

In summary, based on measuring the above biomarkers, taking glyconutrients appears to facilitate improvements in immune health
